

Enterprise-Grade Native KAS Distribution

The Definitive White Paper & Ecosystem Architecture

Version 1.0 • September 2026 • Non-Custodial Multi-Recipient Distribution Platform

1. Executive Summary

KasDistro is a non-custodial bulk distribution platform engineered specifically for the Kasper ecosystem. It empowers projects, communities, token issuers, mining operations, and decentralized organizations to distribute native KAS to massive recipient lists without manual transaction construction or compromised security.

KasDistro supports three primary recipient ingestion vectors:

- Manually entered Kasper target addresses
- KRC-20 token-holder verified snapshots
- KCC-20 token-holder snapshots, including live bonding-curve KRON tokens

Large recipient cohorts are intelligently partitioned into sequential, mass-safe batches of up to **90 recipients per transaction**. Every transaction is independently verified and authorized through KasWare Wallet without relinquishing private key custody.

"KasDistro revenue = completed transactions × 100 KAS. Simple, transparent, and protocol-native."

2. The Problem: Friction in Mass Distribution

Ecosystem participants regularly encounter complex disbursement challenges—from token rewards and mining pool distributions to DAO treasuries and airdrops. Manual distribution introduces severe systemic risks:

- Address transcription corruption and duplicate payments
- Unintentional omissions and inconsistent payment allocations

- Exceeding strict Kaspa transaction storage mass limits
- Failure states that obscure partial completion tracking

The Completeness Principle

A list that appears valid can easily be incomplete or omit critical exclusions. KasDistro enforces a strict operational invariant: *A holder import must be complete, or it must be rejected outright.* Capped top-holder API responses are never silently converted into incomplete distribution runs.

3. Product Overview & Workflow

KasDistro delivers a guided, highly reliable workflow converting raw recipient sets into structured transaction sequences:

1. User connects a compatible KasWare wallet.
2. Recipient source is selected, ingested, and validated.
3. Addresses are deduplicated and purged of ineligible records.
4. Recipients are batched into groups of **90**.
5. Transactions are sequentially constructed, signed via KasWare, and broadcast with an automated **100 KAS service fee** per batch.

RECIPIENT RANGE	MAX BATCH SIZE	REQUIRED TRANSACTIONS	SERVICE FEE TOTAL
1 – 90	90	1	100 KAS
91 – 180	90	2	200 KAS
181 – 270	90	3	300 KAS
901 – 990	90	11	1,100 KAS

* Service-fee destination address:

`kaspa:qz6d1tvkds80wf8raac504ze4nesgnk72n24jr7krum2m8dq34khvkevr88cc`

4. Architectural Design Principles

- **Non-Custodial Authorization:** Zero private key exposure; absolute user sovereignty via KasWare.
- **Mass-Safe Batching:** Capping batches at 90 prevents storage mass limit overflows (e.g., historical 100-recipient mass spikes past `500000`).

- **Sequential UTXO Management:** Prevents double-spending by updating the UTXO state after every individual transaction broadcast.
- **Universal Safeguards:** Hardcoded exclusions purge the canonical burn address (`kaspa:qqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqqkx9awp4e`) and contract-owned covenant inventory (`covenant:`) across all distribution paths.

5. Revenue & Business Model

KasDistro captures sustainable protocol revenue through a hybrid architecture combining per-transaction service fees, professional tiers, and enterprise white-label licensing.

Campaign Scale	Transactions	Gross Protocol Revenue
50 Recipients	1	100 KAS
250 Recipients	3	300 KAS
1,000 Recipients	12	1,200 KAS
5,000 Recipients	56	5,600 KAS
10,000 Recipients	112	11,200 KAS

6. Strategic Roadmap

- Phase 1:** Core native-KAS distribution, KasWare integration, 90-recipient batching, and sequential UTXO handling.
- Phase 2:** Full KCC-20 pagination, KRON pre-graduation support, and burn-address security hardening.
- Phase 3:** Advanced campaign management, saved templates, CSV export, and weighted allocations.
- Phase 4:** Professional subscriptions, multi-wallet treasury approval workflows, and role-based permissions.
- Phase 5:** Enterprise infrastructure, white-label portals, and Merkle-based proof attestations.

7. Conclusion

KasDistro solves the fundamental infrastructure bottleneck of native KAS distribution. By uniting unbreakable non-custodial safety, rigorous token intelligence, and predictable transaction economics, KasDistro stands as the definitive distribution layer for the Kaspero ecosystem.
